

Your Supply Chain Is One Bad Day Away From Jenga

One small disruption.
A whole tower of problems.

Your logistics operation might look stable on paper. But when a delivery runs late, a vehicle breaks down, or demand suddenly spikes, how many other things start falling apart?

One block can bring everything down.

Small issues. Big ripple effects.

Pull One Block. Watch What Happens.

1

The Wrong Address

- Failed delivery attempts
- Extra miles and redelivery costs

2

The Late Dispatch

- Missed delivery windows
- Delays across the schedule

3

The Vehicle Breakdown

- Routes need reassigning
- Fleet utilization takes a hit

4

The Demand Spike

- Capacity gets stretched
- Delivery commitments come under pressure

5

The Disconnected Systems

- Teams work with incomplete information
- Decisions slow down when speed matters most

And Suddenly,
It's Not Just One Problem.

ONE DISRUPTION. A WHOLE TOWER OF TROUBLE.

More delays.

More costs.

More manual firefighting.

Less control over the operation.

The real risk isn't always the first block that moves. It's how many other blocks depend on it.
